Quiz 1

Implement a device which connects Input $X(i)$ to Output $Z(j)$ where i and j are input port and output port selects range between 0 to 3. Other Outputs $Z(k)$'s where k is not equal to j , are assigned to logic '0'. Demonstrate that your implementation is correct.

Entity device is

```
Port (      X : in  std_logic_vector(3 downto 0);
          Z : out std_logic_vector(3 downto 0);
          I, J : in  std_logic_vector(1 downto 0));
End device;
```
